DATA VISUALIZATION

Lecture 10: Graph & Tree Visualization

Outline

- ▶ **Visualizing Trees**
- ▶ **Visualizing Graphs**

Goals

- ▶ Overview of layout approaches
- ▶ Assess strengths and weaknesses
- ▶ Insight into implementation techniques

Graphs and Trees

- ▶ **Graphs**

- ▶ Model relations among data
- ▶ *Nodes and edges*

- ▶ **Trees**

- ▶ **Graphs with hierarchical structure**
Connected graph with $N-1$ edges
- ▶ Nodes as *parents and children*

Spatial Layout

- ▶ A primary concern of graph drawing is the spatial arrangement of nodes and edges.
- ▶ Often (but not always) the goal is to effectively depict the graph structure:
 - ▶ Connectivity, path-following
 - ▶ Network distance
 - ▶ Clustering
 - ▶ Ordering (e.g., hierarchy level)

Applications

- ▶ Tournaments
- ▶ Organization Charts
- ▶ Biological Interactions (Genes, Proteins)
- ▶ Computer Networks
- ▶ Social Networks
- ▶ Simulation and Modeling
- ▶ Integrated Circuit Design
- ▶ Diagramming (e.g., Visio)

Tree Layout

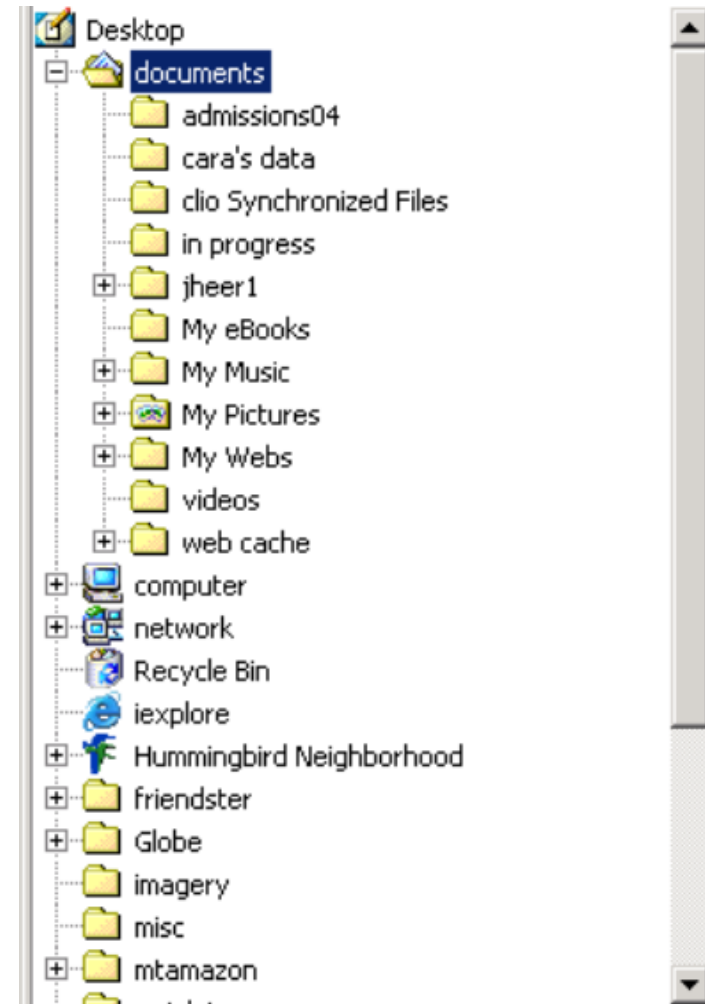

Tree Visualization

- ▶ **Indentation**
 - ▶ Linear list, indentation encodes depth
- ▶ **Node-Link diagrams**
 - ▶ Nodes connected by lines/curves
- ▶ **Enclosure diagrams**
 - ▶ Represent hierarchy by enclosure
- ▶ **Layering**
 - ▶ Relative position and alignment

Indentation

- ▶ Places all items along vertically spaced rows
- ▶ Indentation used to show parent/child relationships
- ▶ Commonly used as a component in an interface
- ▶ Breadth and depth contend for space
- ▶ Often requires a great deal of scrolling

Node-Link Diagram

- ▶ Nodes are distributed in space, connected by straight or curved lines
- ▶ Typical approach is to use 2D space to break apart breadth and depth
- ▶ Often space is used to communicate hierarchical orientation (e.g., towards authority or generality)

Node-Link Diagram

Basic Recursive Approach

- ▶ Repeatedly divide space for subtrees by leaf count
 - ▶ Breadth of tree along one dimension
 - ▶ Depth along the other dimension
- ▶ **Problem:** exponential growth of breadth

Node-Link Diagram

Reingold & Tilford's "Tidy" Layout

- ▶ **Goal:** make smarter use of space, maximize density and symmetry.
- ▶ Originally binary trees, extended by Walker to cover general case.
- ▶ Corrected by Buchheim et al. to achieve a linear time algorithm.

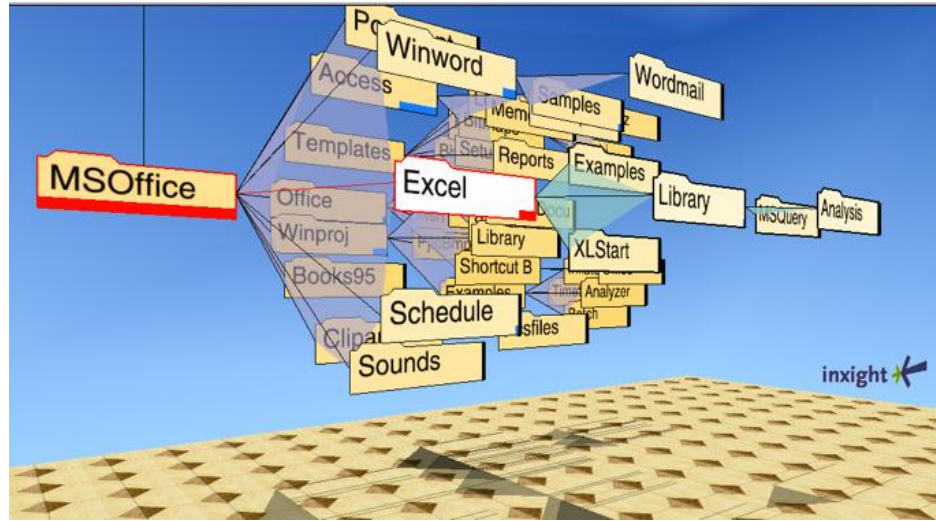

Node-Link Diagram

Radial Layout

- ▶ Node-link diagram in polar coordinates.
- ▶ Radius encodes depth, with root in the center.
- ▶ Angular sectors assigned to subtrees (typically uses recursive approach).
- ▶ Reingold-Tilford method could be applied here.

Node-Link Diagram

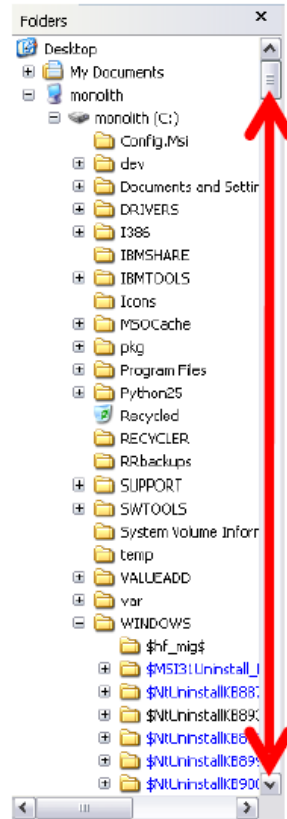

Layout in 3D to form
Cone Trees.

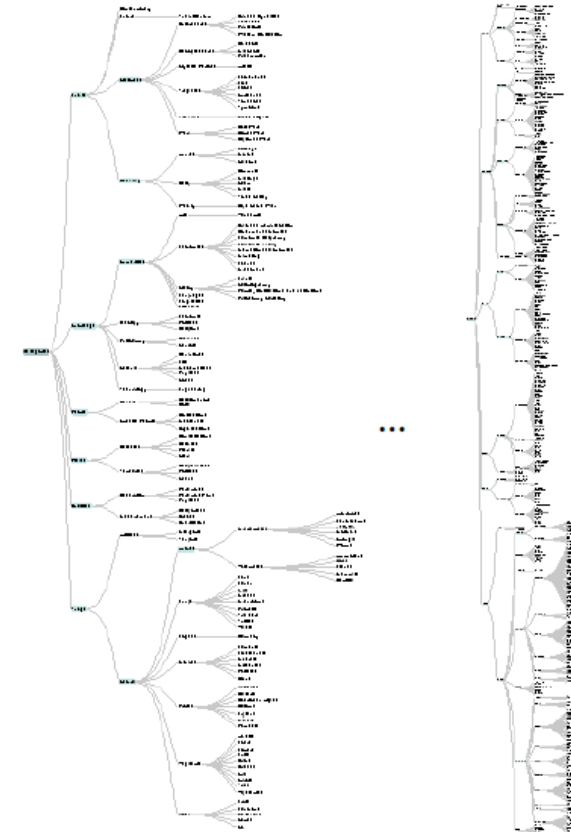

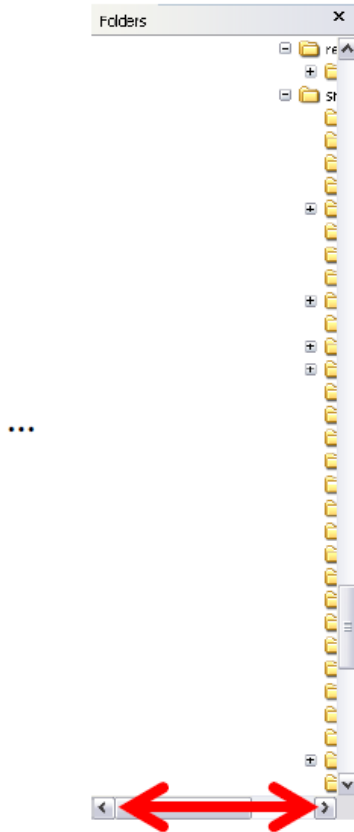

Node-Link Diagram

Visualizing Large Hierarchies

Indented Layout

Reingold-Tilford Layout

Node-Link Diagram

More Nodes, More Problems...

- ▶ **Tree breadth often grows exponentially**
 - ▶ Even with tidy layout, quickly run out of space
- ▶ **Possible Solutions**
 - ▶ Filtering
 - ▶ Focus+Context
 - ▶ Scrolling or Panning
 - ▶ Zooming
 - ▶ Aggregation

Node-Link Diagram

MC Escher, *Circle Limit IV*

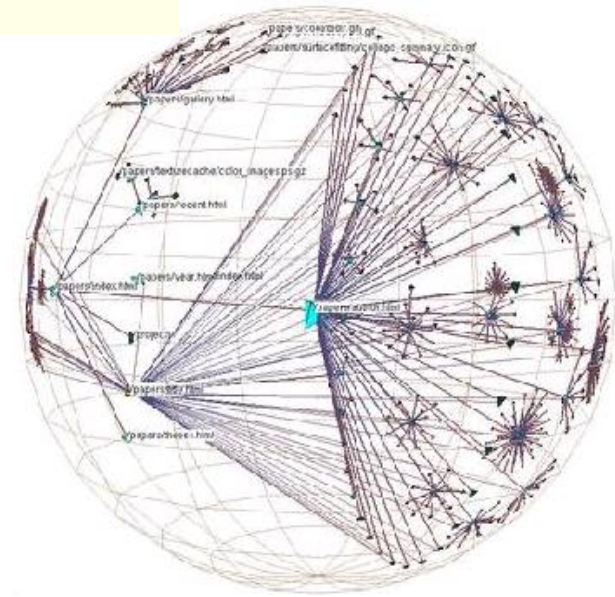

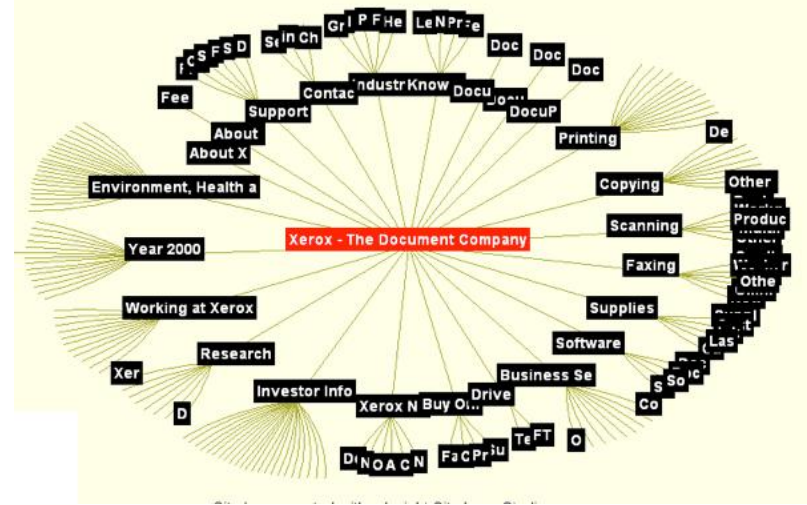

Node-Link Diagram

Hyperbolic Layout

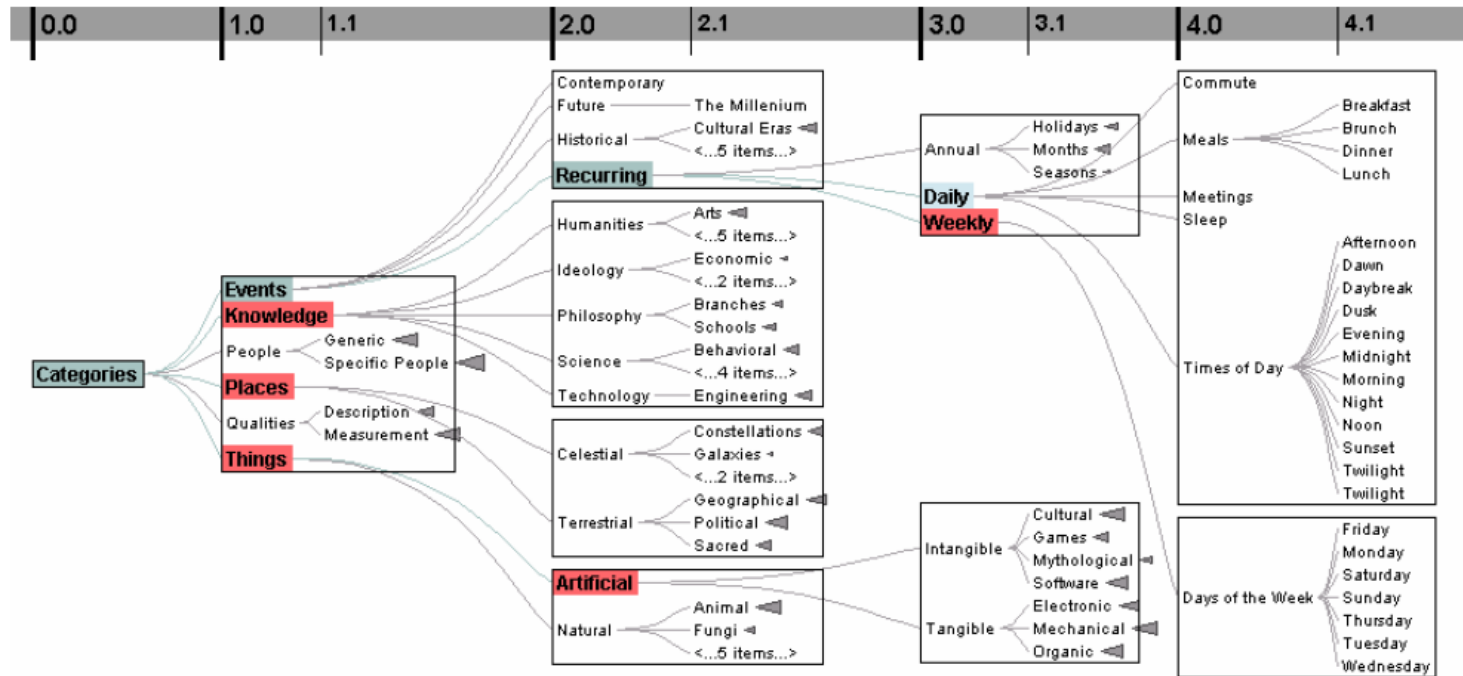

- ▶ Perform tree layout in hyperbolic geometry, project the result on to the Euclidean plane.
- ▶ Why? Like tree breadth, the hyperbolic plane expands exponentially!
- ▶ Also computable in 3D, projected into a sphere.

https://en.wikipedia.org/wiki/Hyperbolic_tree

Node-Link Diagram

Degree-of-Interest Trees

Enclosure Diagram

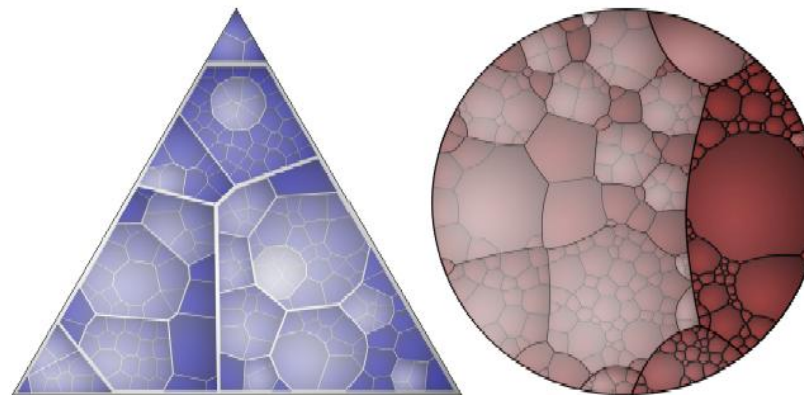

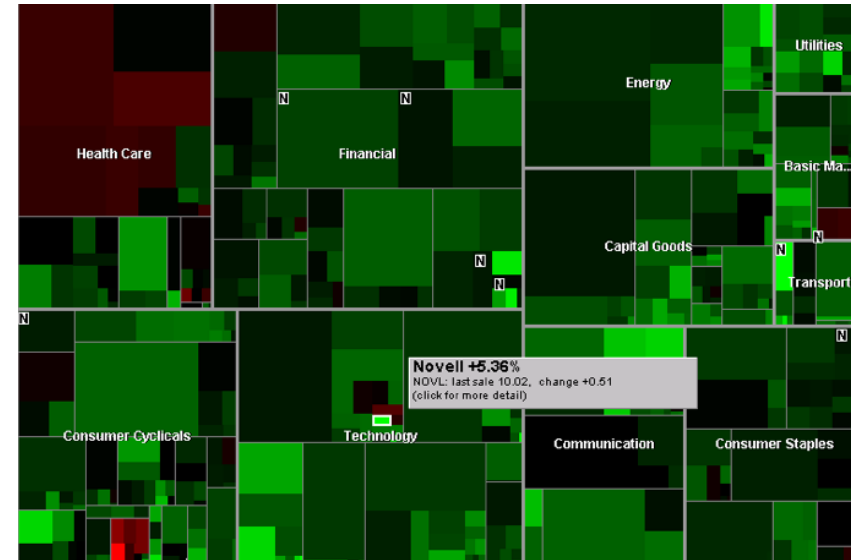

- ▶ Encode structure using **spatial enclosure**.
Popularly known as **treemaps**
- ▶ **Benefits**
Provides a single view of an entire tree
Easier to spot large/small nodes
- ▶ **Problems**
Difficult to accurately read structure / depth

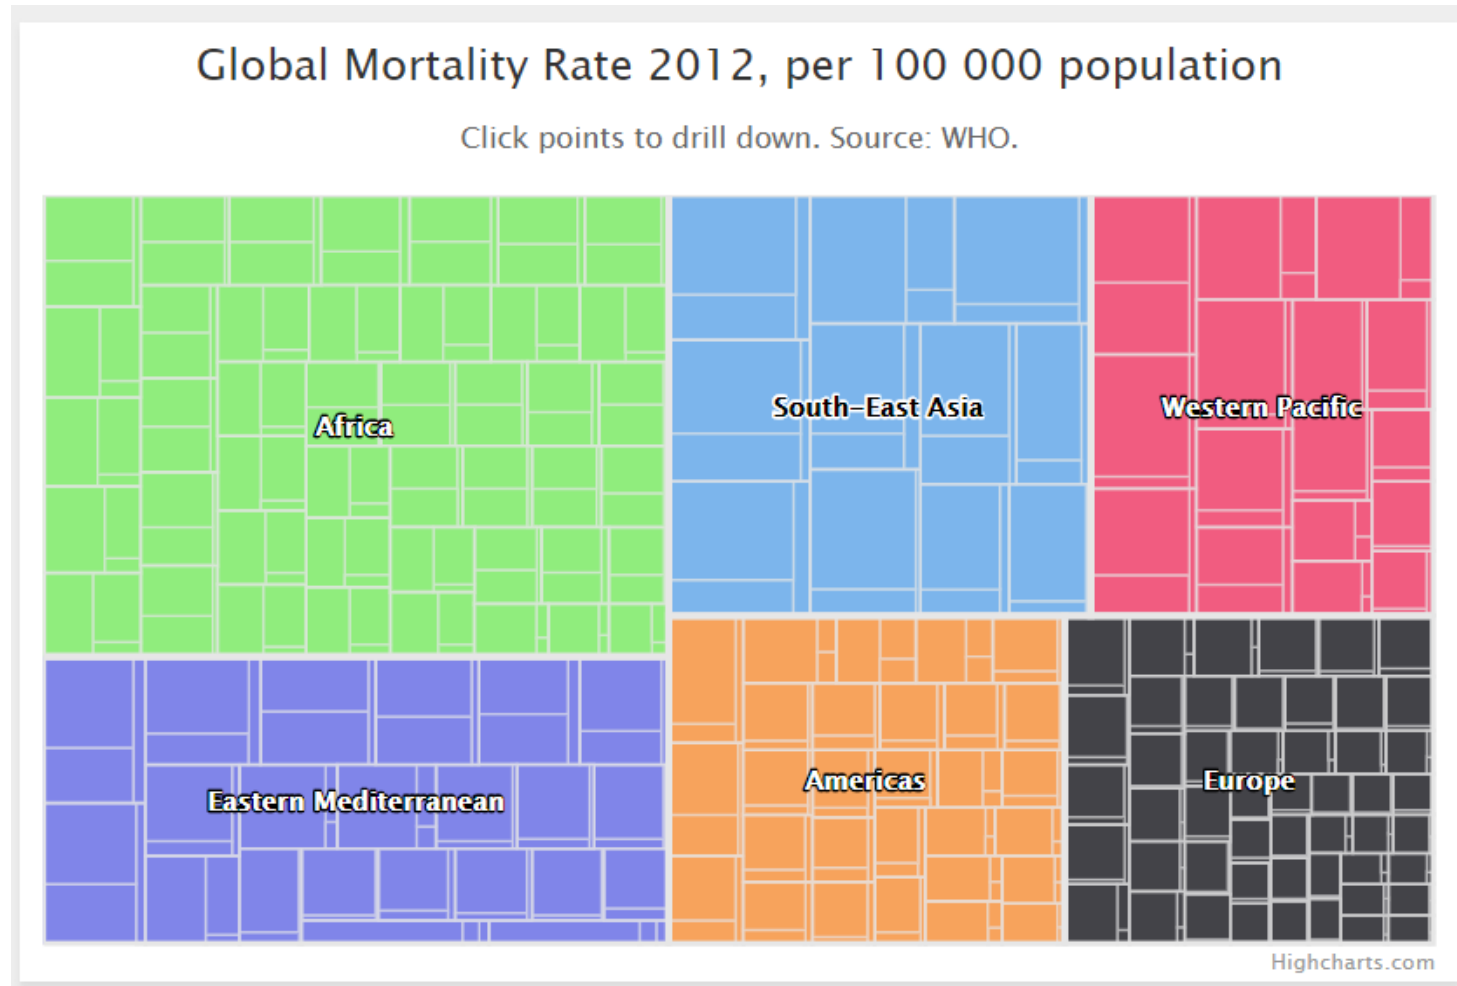

Enclosure Diagram

Treemaps

- ▶ Recursively fill space.
- ▶ Enclosure signifies hierarchy.
- ▶ Additional measures can be taken to control aspect ratio of cells.
- ▶ Often uses rectangles, but other shapes are possible, e.g., iterative Voronoi tessellation.

Hierarchical Treemaps for Large Dataset

Layered Diagrams

- ▶ Signify tree structure using
 - ▶ Layering
 - ▶ Adjacency

- ▶ Involves recursive sub-division of space.

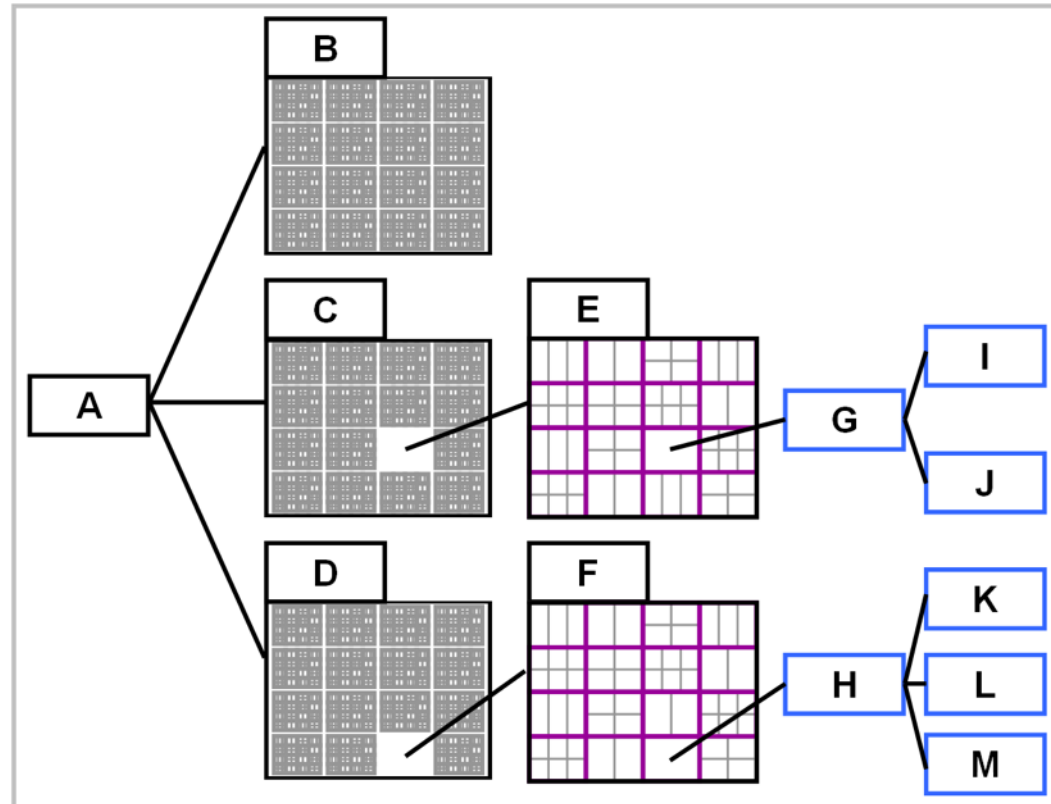

Layered Diagrams

Layered Tree Drawing

Hybrid Trees

“Elastic Hierarchies”

- ▶ Node-link diagram with treemap nodes.

Graph Layout

Approaches to Graph Drawing

- ▶ **Calculation using Graph Structure**
 - ▶ Spanning tree layout
 - ▶ Sugiyama-style (hierarchical) layout
 - ▶ Adjacency matrix layout
- ▶ **Optimization Methods**
 - ▶ Constraint satisfaction
 - ▶ Force-directed layout
- ▶ **Attribute-Driven Layout**
 - ▶ Layout using data attributes, not linkage

Calculation using Graph Structure

Calculation using Graph Structure

Tree-based graph layout

- ▶ Select a **tree-structure** out of the graph
 - ▶ Minimum spanning tree
 - ▶ Breadth-first-search tree (BFS)
 - ▶ Depth-first-search tree (DFS)
 - ▶ Other domain-specific structures
- ▶ Use a tree layout algorithm
- ▶ **Benefits:** Fast, supports interaction & refinement
- ▶ **Drawbacks:** Limited range of layouts

Calculation using Graph Structure

Spanning Tree Layout

- ▶ **Many graphs have useful spanning trees**
 - ▶ Websites,
 - ▶ Social Networks

Calculation using Graph Structure

Hierarchical graph layout

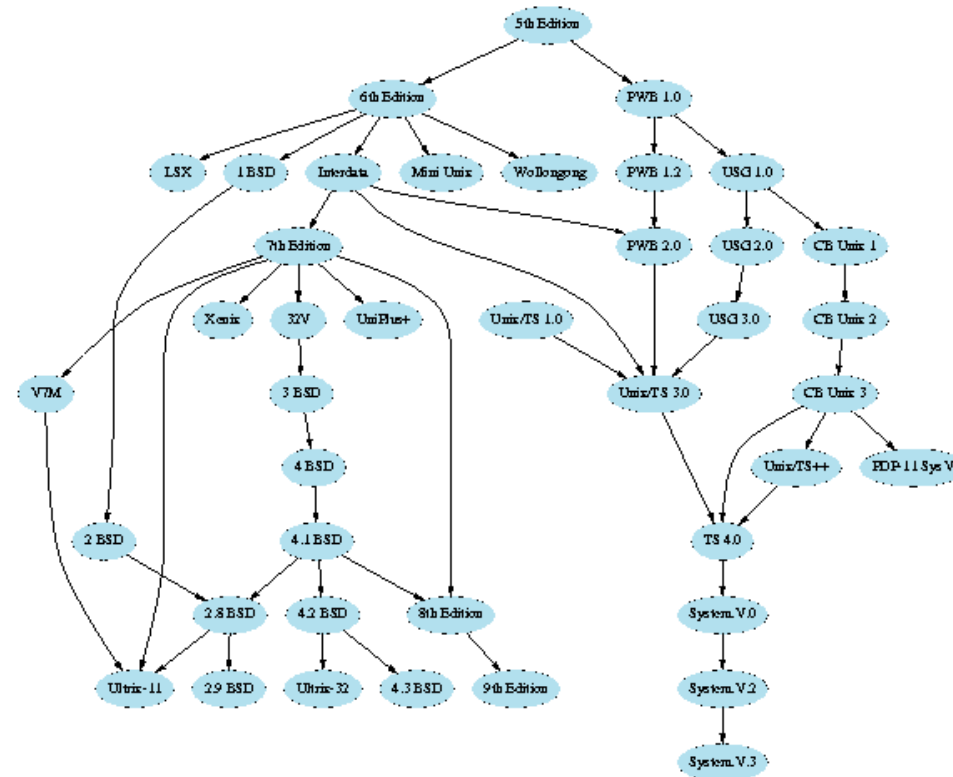

- ▶ Use **directed-structure** of graph to form layout
- ▶ Order graph into distinct levels
 - ▶ this determines one dimension
- ▶ Now **optimize within levels**
 - ▶ determines the second dimension
 - ▶ minimize edge crossings, etc
- ▶ Great for directed acyclic graphs, but often misleading in case of cycles

Calculation using Graph Structure

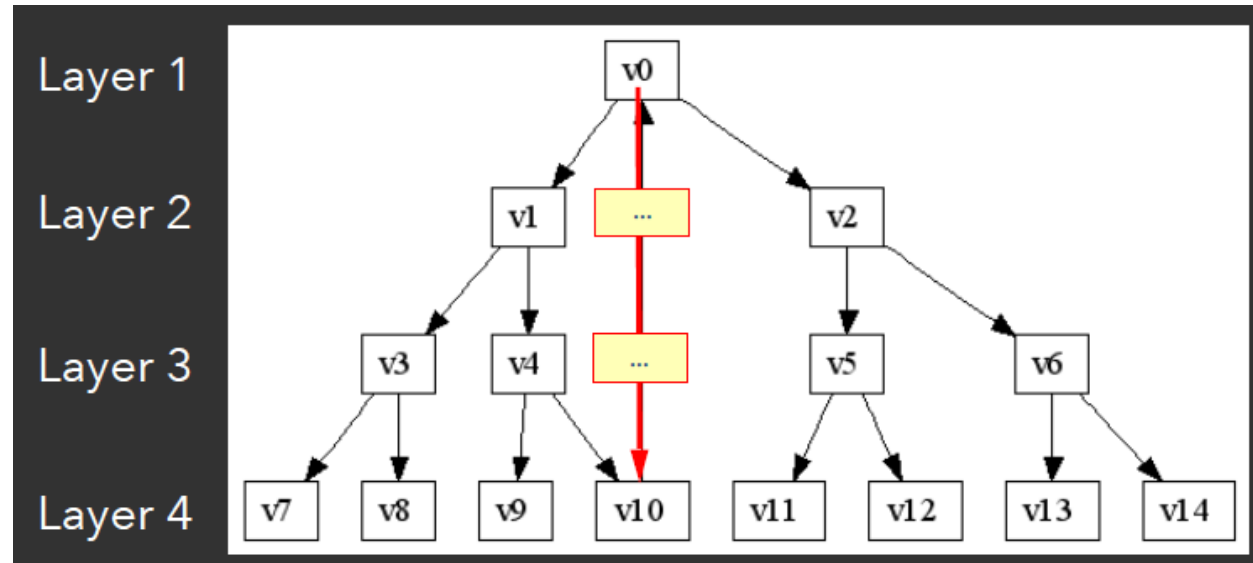

Sugiyama-Style Layout

- ▶ Evolution of the UNIX operating system
- ▶ Hierarchical layering based on descent

Calculation using Graph Structure

Sugiyama-Style Layout

- ▶ Reverse edges to **remove cycles**
- ▶ Assign nodes to **hierarchy layers**
- ▶ Create dummy nodes to **“fill in” missing layers**
- ▶ Arrange nodes within layer, **minimize edge crossings**
- ▶ **Route edges** – layout splines if needed

Calculation using Graph Structure

Sugiyama-Style Layout

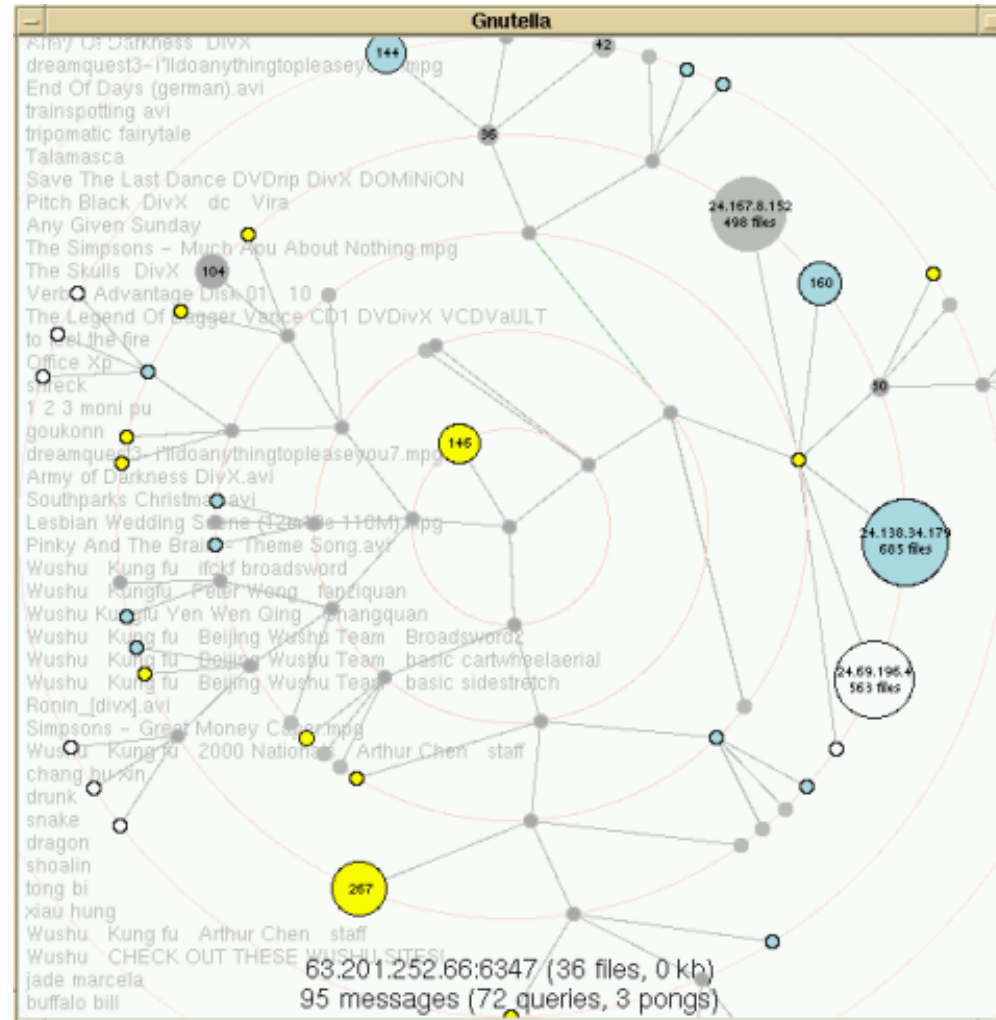

- ▶ Hierarchical Layout

Calculation using Graph Structure

Radial layout

- ▶ Animated exploration of graphs with radial layout

Optimization Techniques

Optimization Techniques

- ▶ **Treat layout as an *optimization problem***
 - ▶ Define layout using an *energy model along with constraints: equations the layout should obey.*
 - ▶ Use optimization algorithms to solve
- ▶ **Commonly posed as a physical system**
 - ▶ Charged particles, springs, drag force, ...
- ▶ **We can introduce directional constraints**
 - ▶ *DiG-CoLa (Di-Graph Constr Optimization Layout) [Dwyer 05]*
 - ▶ Iterative constraint relaxation

Optimization Techniques

- ▶ Minimize edge crossings
- ▶ Minimize area
- ▶ Minimize line bends
- ▶ Minimize line slopes
- ▶ Maximize smallest angle between edges
- ▶ Maximize symmetry

but, can't do it all!

Optimizing these criteria is often NP-Hard, requiring approximations.

min # crossings

max symmetries

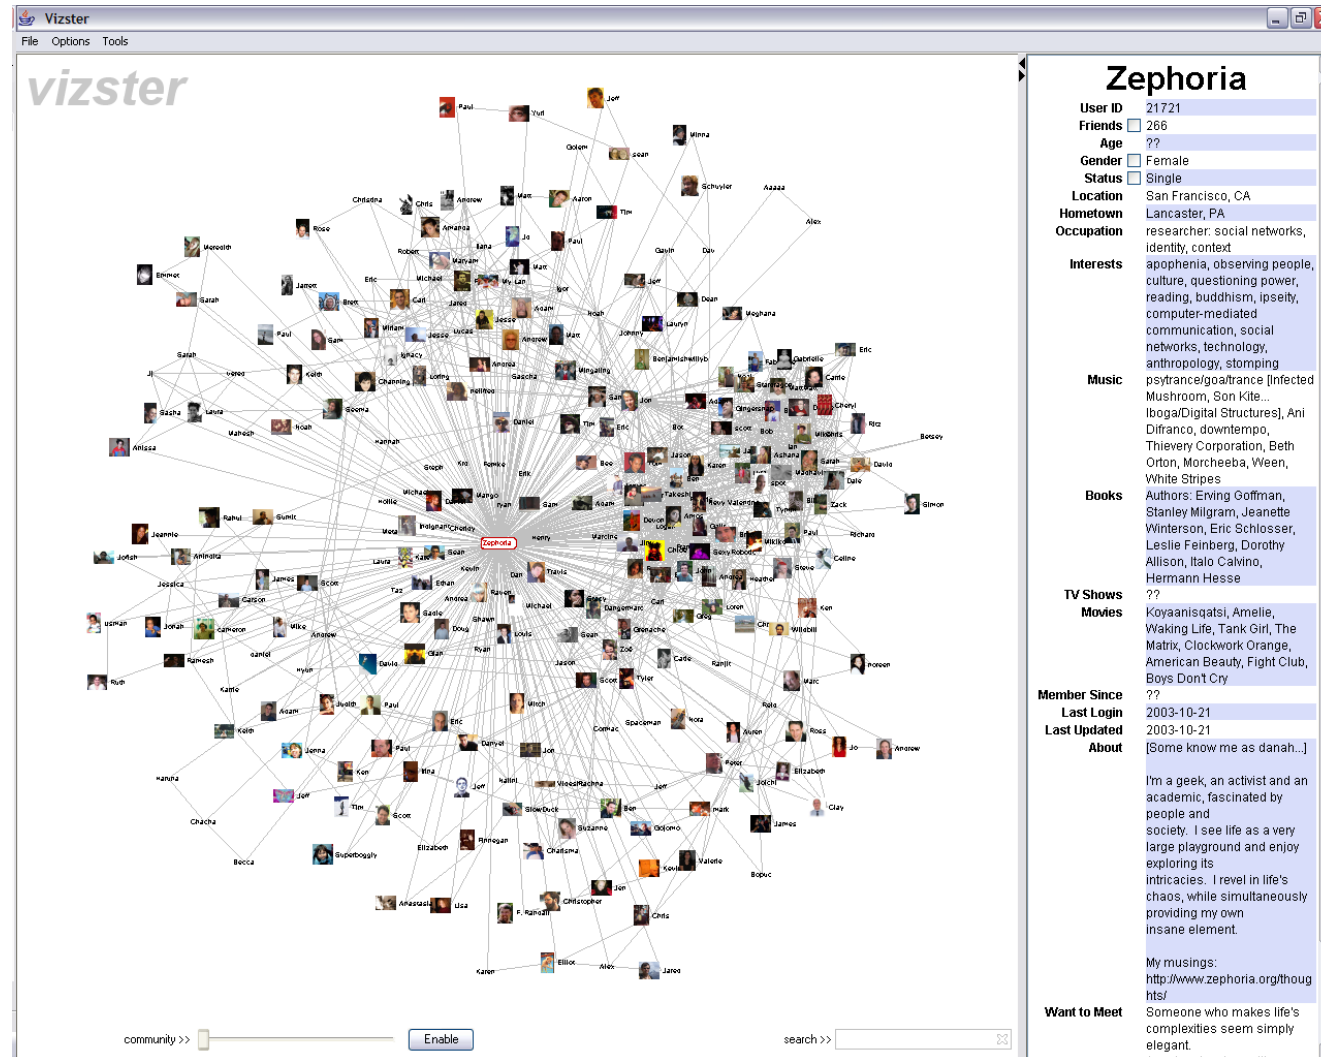

Optimization Techniques

Force-directed Layout

- ▶ Nodes = charged particles
with air resistance
- ▶ Edges = springs
- ▶ **Iteratively calculate forces, update node positions**
- ▶ Naïve n-body calculation is $O(N^2)$
- ▶ $O(N \log N)$ using quadtree or k-d tree
- ▶ Numerical integration of forces at each time step

Optimization Techniques

Optimization Techniques

Constrained Optimization

- ▶ **Minimize stress function**

$$\text{stress}(X) = \sum_{i < j} w_{ij} (\|X_i - X_j\| - d_{ij})^2$$

where

X : node positions, d : optimal edge length,

w : normalization constants

- ▶ *Note: Try to place nodes d_{ij} apart*

Optimization Techniques

Constrained Optimization

- ▶ **Add hierarchy ordering constraints**

$$EH(y) = \sum_{(i,j) \in E} (y_i - y_j - \delta_{ij})^2$$

where

y : node y -coordinates

δ : edge direction (e.g., 1 for $i \rightarrow j$, 0 for undirected)

- ▶ *Note: If i points to j , it should have a lower y -value*

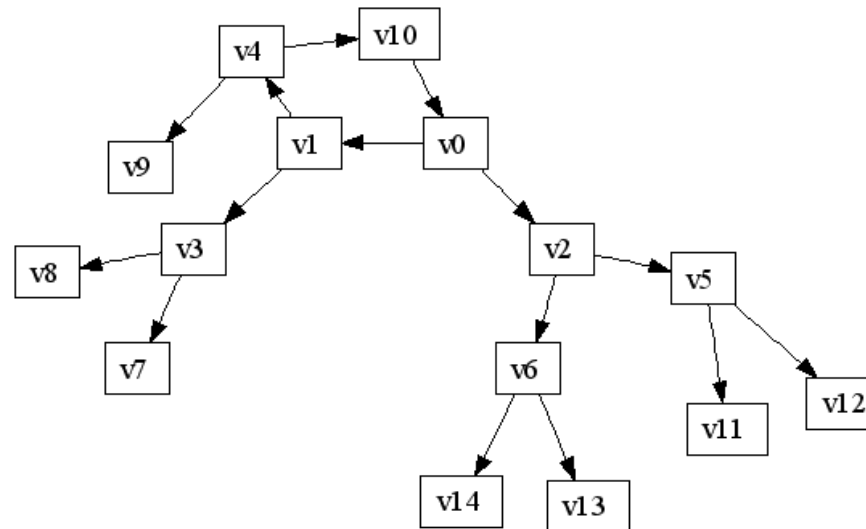

Optimization Techniques

Sugiyama layout (dot)
Preserve **tree structure**

DiG-CoLa method
Preserve **edge lengths**

Optimization Techniques

(a) 1 band

(b) 6 bands

(c) 4 bands

(d) 2 bands

Optimization Techniques

Iterative Constraint Relaxation

- ▶ Quadratic programming is complex to code and computationally costly. Is there a simpler way?
- ▶ Iteratively **relax each constraint** [Dwyer 09]
- ▶ Given a constraint (e.g., $|x_i - x_j| = 5$)
 - ▶ Simply push the nodes to satisfy!
 - ▶ Each relaxation may **clobber prior results**
- ▶ But this typically **converges quickly**
- ▶ Enables **expressive constraints!**

Use the Force!

<http://mbostock.github.io/d3/talk/20110921/>

Optimization Techniques

- ▶ Limitations of Node-Link Layout

Attribute-driven Layout

Attribute-Driven Layout

- ▶ Large node-link diagrams **get messy!**
 - ▶ Is there additional structure we can exploit?
- ▶ **Idea:** Use **data attributes** to perform layout
 - ▶ For example, scatter plot based on node values
- ▶ *Dynamic queries / brushing to explore...*

Attribute-Driven Layout

- ▶ The “**Skitter**” Layout
 - ▶ Internet Connectivity
 - ▶ Radial Scatterplot
- ▶ **Angle = Longitude**
 - ▶ Geography
- ▶ **Radius = Degree**
 - ▶ # of connections
(a statistic of the nodes)

Attribute-Driven Layout

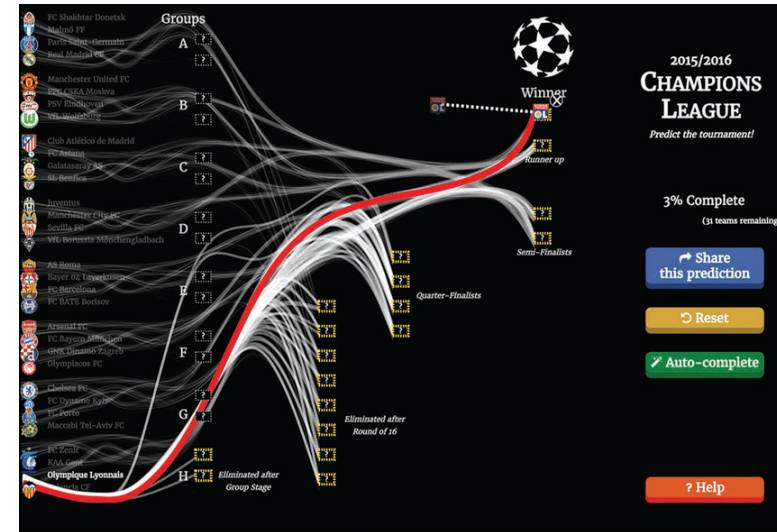

- ▶ The **Call Graph**
- ▶ Three concentric rings show containment
 - ▶ Files
 - ▶ Classes
 - ▶ Methods
- ▶ The curved lines indicate function calls

Example: Graph Visualizations in Sports

ACC Basketball Tournament Series Records

Hover over team's logo to see its all-time tournament record

Summary

Visualizing Trees

- ▶ Indentation
- ▶ Node-Link diagrams
- ▶ Enclosure diagrams
- ▶ Layering

Visualizing Graphs

- ▶ Calculation using Graph Structure
 - ▶ Tree-based, hierarchical layouts
- ▶ Optimization Methods
 - ▶ Force-directed layout
- ▶ Attribute-Driven Layout
 - ▶ Skitter layout
